(a) Solamente los últimos seis meses del año, los cuales dan usualmente cifras más altas debido a causas estacionales.

La velocidad es un índice que se obtiene dividiendo el valor total de los cheques entre el valor total de los depósitos, dentro del mismo período. Los índices anuales se obtienen promediando los índices mensuales.

Las cifras correspondientes a cheques pagados por cuenta del gobierno y entidades públicas comprenden también el valor de cheques girados por los bancos privados.

(a) Los datos se toman de los balances de los bancos. Los totales son ligeramente superiores a los que encontramos en las otras series de préstamos y descuentos, iniciadas en septiembre de 1949. Ello se debe a la inclusión, dentro de esta serie, de los créditos registrados en los departamentos no bancarios del Crédito Hipotecario Nacional, de los intereses devengados y de los créditos concedidos por el Banco Lippmann.
